

Summit WM3000 Series WLAN Controllers

*High-performance wireless LAN controller platforms
for advanced wireless services.*

Enterprise-Class Mobility

- High-speed, cross-subnet roaming
- End-to-end Quality of Service (QoS)
- Large-scale clustering with high availability

Comprehensive Security Features

- Role-based firewall
- IPSec VPN Gateway
- Wireless intrusion detection and prevention

Value-Add Mobility Services

- Real Time Location Services (RTLS)
- Enhanced guest services

Summit WM3000 series controllers are purpose built to enable highly scalable and available wireless networks with support for most mobility applications.

Summit® WM3000 series controllers provide a scalable high-performance Wireless LAN (WLAN) solution that is easy to use and offers robust security features. In today's enterprise environments, dedicated resources are rarely available to build and operate the wireless network. By focusing on ease of installation and management, the Summit wireless mobility solution from Extreme Networks® enables IT organizations to simplify the task of mobilizing their users without compromising security or performance.

Summit WM3000 series controllers enable support of the most advanced wireless LAN applications. With high-speed, cross-subnet roaming and sophisticated multicast support, Summit WM3000 series controllers offer the features needed for IT to meet mobile voice or multimedia networking challenges. Summit WM3000 series controllers can scale to support the largest WLAN installations while providing centralized management for remote office installations.

Summit WM3600 offers comprehensive wireless controller functionality for medium to large enterprises. With ExpressCard™ slot it is 3G wireless ready for remote site survivability. Summit WM3700 controller is designed for large-scale, high-bandwidth, multi-site enterprise deployments.

Summit WM3400 controller is ideal for small to medium enterprises and branch offices of large enterprises. It integrates wired, wireless and security networking features into a compact and easy-to-use form factor for zero touch installation. It comes with integrated six AP license, 3G license, Stateful/Role-based Firewall, IPSec VPN Gateway, IDS/IPS engine, and Wi-Fi RFID location engine.

Enterprise-Class Mobility

Summit WM3000 controllers offer scalability in capacity and performance, and help protect user investment.

High-Speed, Cross-Subnet Roaming

Summit WM3000 series controllers support Layer 2/Layer 3 inter-controller roaming. Inter-controller Layer 3 roaming allows clients to roam between controllers which are not on the same LAN or IP subnet. This allows controllers to be placed in different locations on the network. Using standards-based 802.11i PMK caching mechanisms, the roaming process is speeded up since it allows a client to re-use previous PMK authentication credentials and perform a four-way handshake. In addition to reusing PMKs on previously visited APs, Opportunistic Key Caching allows multiple APs to share PMKs amongst themselves. This allows a client to roam to an AP that it has not previously visited and reuse a PMK from another AP to skip the 802.1x authentication.

End-to-End Quality of Service

QoS provides policy enforcement for mission-critical applications and for users that have critical bandwidth requirements when the controller's bandwidth is shared by different users and applications. The Summit WM3000 controllers' architecture offers end-to-end QoS from the wireless client to the packet destination. QoS can be configured for different classes of users through the virtual APs or SSIDs. The wireless QoS solution maintains the traffic priority from client to destination. Over-the-air, latency-sensitive traffic is given priority transmit access using either the SpectraLink Voice Protocol (SVP) or 802.11e Wireless Multimedia (WMM) priority management. Summit WM controllers map the wireless QoS to wired Layer 2 (802.1p) and Layer 3 (DSCP) QoS markings for upstream and downstream traffic.

The Summit WM controllers support Call Admission Control (CAC) as per IEEE 802.11e based Traffic Specifications (TSPEC). CAC is a traffic management technique that regulates the number of calls for better roaming. A client can request a new voice session with specific

traffic stream parameters including QoS. These parameters are part of the TSPEC associated with a session request. The Summit WM controller can accept or reject the session request based on the availability of network resources to enable the requested level of service. It also prevents oversubscription of network resources that can result in service degradation and poor voice quality.

The Unscheduled Automatic Power Save Delivery (UAPSD) feature, also known as WMM power save, defines an unscheduled service period, which are contiguous periods of time during which the controller is expected to be awake. If the controller establishes a downlink flow and specifies UAPSD power management, it requests (and the AP delivers) buffered frames associated with that flow during an unscheduled service period. The controller initiates an unscheduled service period by transmitting a trigger frame. A trigger frame is defined as a data frame (e.g. an uplink voice frame) associated with an uplink flow with UAPSD enabled. After the AP acknowledges the trigger frame, it transmits the frames in its UAPSD power save buffer addressed to the triggering controller. UAPSD is well suited to support bi-directional frame exchanges between a Wi-Fi handset and its AP.

Large-Scale Clustering with High Availability

A set of Summit WM3000 controllers can be clustered to create a mobility domain and a redundancy group. Within the cluster, controllers discover and establish connections to controllers. The cluster has full mesh connectivity. Up to 12 controllers can be configured as members of a cluster to significantly reduce the chance of a disruption in service to WLANs and associated clients in the event of failure of a controller or intermediate network failure.

In the event of a controller failure, an existing cluster member assumes control. Therefore, the controller-supported network remains up and running even if a

controller fails or is removed for maintenance or a software upgrade. Each redundancy group is capable of supporting an Active/Active configuration responsible for group load sharing. Members within the same redundancy group can be deployed across different subnets. APs can be load balanced across members of the group. AP capacity licenses are aggregated across the cluster. When a new member joins the cluster, the new member can leverage the AP license(s) of existing members.

Comprehensive Security

Comprehensive network security features help keep the mission-critical wireless network and resources secure and provide compliance for HIPAA and PCI. The Summit WM3000 series controllers provide a layered approach to protect and secure data at every point in the network, wired or wireless. The Summit WM3000 series controllers offer a complete range of privacy options ranging from unencrypted communication for guests, shared key for phones and PDAs, to WPA and WPA2 for enterprise-class applications. For high performance and scalability, all over-the-air encryption connections are terminated at the AP with hardware acceleration. Each defined SSID specifies how the wireless user or device should authenticate, with options for browser-based login, MAC address verification or 802.1x enterprise AAA identity management. MAC address authentication can be combined with other link security types for additional protection.

The Summit WM3000 series controllers can be configured to disallow traffic exchanged between the clients on individual SSIDs. Once enabled on a SSID, the controller will block at Layer 2 any communication attempts made between all client MAC addresses associated to the SSID.

Firewalls

Firewalls protect networks from unauthorized traffic. The Summit WM3000 series controllers' supported firewalls allow authorized traffic while blocking unauthorized traffic. They support Stateful Layer 2 and role-based firewalls. Stateful Layer 2 Firewalls allow established sessions to continue after a client roams. Role-based firewalls base the security policy on user group location, encryption strength, etc. It follows a user as it roams across different APs and controllers.

IPSec VPN Gateways

IPSec VPN offers the security and encryption features necessary to protect enterprise data, voice, and video traffic as it traverses public or insecure networks. IPSec VPN can be deployed to provide secure point-to-point connectivity between sites as well as provide users remote access into the network eliminating costly dial-up and leased lines. Summit WM3000 controller supports IPSec termination for site-to-site VPN and IPSec termination for remote access VPN. The controller also supports IPSec traversal of firewall filtering, IPSec traversal of NAT and IPSec/L2TP (client to controller).

Wireless IDS/IPS

Unauthorized AP detection is directly integrated into the Summit WM3000 series controllers – when enabled this allows the Summit WM3000 controller to monitor the RF environment for unauthorized APs. Unauthorized APs can be reported to the controller from managed radios configured to perform scanning. The controller enables an attached AP to scan the channels for such threats and report them. The AP can scan for threats on its channel or on all channels in that band. The controller analyzes the data and determines which APs are unauthorized and creates an alert and a report. APs that have been categorized as unapproved represent a potential threat to the network. Unauthorized AP containment can be used to provide temporary mitigation against active unauthorized APs operating at a site by attempting to disrupt communications with any associated clients as well as attempting to prevent new clients from associating with the AP.

The Summit WM3000 series controllers and Altitude™ 3500 series access points seamlessly integrate with Motorola

AirDefense WIPS. One of the radios on the access point can be converted into dedicated AirDefense sensors. The AirDefense Enterprise server can detect and trust APs managed by the Summit WM3000 controller. The AirDefense Enterprise server can blacklist suspicious clients by creating wireless filters on the controller. Administrators can launch the AirDefense GUI from within Extreme Networks Wireless Management Suite (WMS). The AirDefense Enterprise server can forward SNMP traps to WMS to provide centralized alarm reporting and correlation.

Value Add Mobility Services

Real Time Location System

Real Time Location System (RTLS) is a wireless radio frequency solution that continually monitors and reports in real time the location of tracked resources. The Extreme Networks RTLS solution leverages standards-based 802.11a/b/g APs and the Low Level Reader Protocol (LLRP) allowing the Summit WM3000 controller to provide location services for standard 802.11 devices and tags as well as RFID enabled devices and tags. By eliminating the need to purchase overlay location engines, the Extreme Networks WLAN system can provide standard data, video and voice WLAN services to users while simultaneously tracking Wi-Fi and RFID devices providing faster deployments and lowering capital and operating expenditure. An RTLS feature license for the Summit WM3000 controller enables API for 3rd party RTLS applications. In addition Extreme Networks provides support for 3rd party RTLS solutions from industry-leaders like AeroScout.

Enhanced Guest User Services

Guest authentication offers a simple way to provide secure authenticated access on a WLAN for users and devices using a standard web browser. Guest user authentication allows enterprises to offer authenticated access to the network by capturing and re-directing a web browser session to a captive portal login page where the user must enter valid credentials to be granted access to the network.

This service can be utilized for multiple applications including guest and visitor access or private user access and can be found in enterprise, hospitality, health-care, transportation and education

environments. Guest authentication is fast becoming a popular means for authenticating users and devices as it provides administrators with the means for performing authentication without deploying 802.1X or distributing shared keys. Visitors and guest users at a site would be provided with a temporary username and password from front desk personnel during the sign-in process which would permit access to the network for the duration of their visit. Once the allotted time for the guest account expires, the user would be denied access to the network.

Another common application for the guest access feature is to provide authenticated access to private networks for unmanaged devices. In certain vertical markets, such as education, administrators need to provide access to unmanaged devices that are owned and maintained by end users like students and faculty. In environments such as education, the make, model and OS of the end-user devices varies making 802.1X very challenging to deploy, manage and maintain. Web-based guest user authentication provides an elegant way to solve these administrative challenges.

The web-based guest user administrator tool provides the ability to create guest user accounts on the local database on the Summit WM controller. The guest user provisioning tool is designed for non-administrative users such as front desk personnel and provides:

- Ability to assign the user to a group which determines WLAN, time of day, day of week and bandwidth policies. The group can also be utilized to assign a role to the users when the role-based firewall is employed.
- Ability to print a card which contains the username, password and allotted time information.
- The ability to create guest user accounts with user defined or random usernames and password.
- Ability to specify date and time when the account is active and deactivated.

Technical Specifications

Summit WM3400

AP Capacity

- Up to 6 APs (Thin or Adaptive)
- 72 APs (Thin or Adaptive) per cluster

SSIDs

- Supports 24 SSIDs
- Multi-ESS/BSSID traffic segmentation
- VLAN to ESSID mapping
- Auto Assignment of VLANs (on RADIUS authentication)
- Power Save Protocol Polling
- Pre-emptive roaming
- Congestion control with Bandwidth Management
- Multiple SSIDs per VLAN

Packet Forwarding

802.1D-1999 Ethernet bridging; 802.11-.802.3 bridging; 802.1Q VLAN tagging and trunking; proxy ARP; IP packet steering-redirection

Network Security

Firewall

- Role-based wired/wireless firewall (L2-L7) with stateful inspection for wired and wireless traffic; Active firewall sessions; protects against IP Spoofing and ARP Cache Poisoning

Anomaly Analysis

Source Media Access Control (MAC) = Dest MAC; Illegal frame sizes; Source MAC is multicast; TKIP countermeasures; all zero addresses

Authentication

- Pre-shared keys (PSK)
- 802.1x/EAP – transport layer security (TLS), tunneled transport layer security (TTLS), protected EAP (PEAP)
- Kerberos Integrated AAA/RADIUS Server with native support for EAP-TTLS, EAP-PEAP (includes a built-in user name/password database)
- Supports LDAP and EAP-SIM

Transport Encryption

- WEP 40/128 (RC4), KeyGuard, WPA—TKIP, WPA2-CCMP (AES), WPA2-TKIP

IEEE 802.11w

Provides origin authentication, integrity, confidentiality and replay protection of management frames for 802.11w supported access points

IPSec VPN Gateway

- Supports DES, 3DES, AES-128 and AES-256 encryption, with site-to-site and client-to-site VPN capabilities

Secure Guest Access

- URL redirection for user login
- Local web-based authentication
- Customizable login/welcome pages
- Support for external authentication/billing systems
- Web interface for Guest Account setup by non-IT personnel

Access Control Lists

- Layer 2/Layer 3/Layer 4 ACLs

Geofencing

- Add location of users as a parameter that defines access control to the network

Wireless IDS/IPS

- Multi-mode rogue AP detection
- Rogue AP Containment
- 802.11n Rogue Detection
- Ad-Hoc; Network Detection
- Denial of Service protection against wireless attacks, client blacklisting, excessive authentication/association; excessive probes; excessive disassociation/deauthentication; excessive decryption errors; excessive authentication failures; excessive 802.11 replay; excessive crypto IV failures (TKIP/CCMP replay); Suspicious AP, Authorized device in ad-hoc mode, unauthorized AP using authorized SSID, EAP Flood, Fake AP Flood, ID theft, ad-hoc advertising Authorized SSID

Wireless RADIUS Support (Standard and Extreme Networks Vendor Specific Attributes (VSA))

- User Based VLANs (Standard)
- User Based QoS (Extreme Networks VSA)
- Location Based Authentication (Extreme Networks VSA)
- Allowed ESSIDs (Extreme Networks VSA)

NAC Support with third party systems from Microsoft and Symantec

Quality of Service (QoS) Layer 3 Mobility (Inter-Subnet Roaming)

Wireless Priority

- 802.11 traffic prioritization and precedence

Wi-Fi Multimedia Extensions

- WMM
- WMM Power Save (U-APSD)
- TSPEC Admission Control

SIP Call Admission Control

Controls the number of active SIP sessions initiated by a wireless VoIP phone

802.11k

Provides radio resource management to improve client throughput (11k client required)

Classification and Markings

- Layer 1-4 packet classification; 802.1p VLAN priority; and marking: DiffServ/TOS

IGMP Snooping

- Optimizes network performance by preventing flooding of the broadcast domain

IPv6 Client Support

Real Time Location System

- RSSI based triangulation for Wi-Fi assets
- Tags supported: Ekahau, Aeroscout, Newbury, Gen 2 Tags
- RFID support: Compliant with LLRP protocol. Built-in support for the following Motorola RFID readers: fixed (XR440, XR450, XR480)

System Resiliency and Redundancy

- Active:Standby; Active:Active and N+1 redundancy with access point load balancing; Critical resource monitoring
- Dual Firmware bank supports Image Failover capability
- Single virtual IP (per VLAN) for a switch/controller cluster to use as the default gateway by mobile devices or wired infrastructure
- SMART RF: Network optimization to ensure user quality of experience at all times by dynamic adjustments to channel and power (on detection of RF interference or loss of RF coverage/neighbor recovery)

System Extensibility

- ExpressCard™ Slot: Driver support for 3G wireless cards for WAN backhaul
- AT&T (NALA) – Option GT Ultra Express
- Verizon (NALA) – Verizon Wireless V740 Express Card
- Vodaphone (EMEA) – Novatel Merlin XU870
- Vodaphone (EMEA) – Vodaphone E3730 3G Expresscard
- Telstra (Australia) – Telstra Turbo 7 series Expresscard (Aircard 880E)
- General Use (NALA/APAC) – Novatel Merlin XU870

Management

- Command line interface (serial, telnet, SSH);
- Secure Web-based GUI (SSL) for the wireless switch and the cluster
- SNMP v1/v2/v3; SNMP traps—40+ user configurable options; Syslog; TFTP Client
- Secure network time protocol (SNTP)
- Text-based switch configuration files
- DHCP (client/server/relay), switch auto-configuration and firmware updates with DHCP options; multiple user roles (for switch access)
- MIBs (MIB-II, Etherstats, wireless controller specific monitoring and configuration)
- Email notifications for critical alarms
- Client naming capability

Physical Specifications

Form Factor

- 1U Rack Mount

Dimensions

- 1.75 in H x 12 in W x 10 in D
- 44.45 mm H x 304.8 mm W x 254.0 mm D

Weight

- 4.75 lbs/2.15 kg

Interfaces

- 1x Uplink Port -10/100/1000 Cu/Gigabit SFP interface
- 5x 10/100/1000 Cu Ethernet Ports, 802.3af and 802.3at Draft
- 1x USB port
- 1x ExpressCard Slot
- 1x Serial Port (RJ45 style)

Technical Specifications

Summit WM3400

Power Specifications

- AC input voltage: 100 – 240 VAC
- Max AC input current 3A
- Input frequency: 47 Hz to 63 Hz

Environmental Specifications

- Operating temperature: 0° C to 40° C (32° F to 104° F)
- Storage temperature: -40° C to 70° C (-40° F to 158° F)
- Operating humidity: 5% to 85% (w/o condensation)
- Storage humidity: 5% to 85% (w/o condensation)
- Heat dissipation: 95 BTU per hour

Regulatory

- UL/cUL 60950-1, IEC/EN60950-1
- EMC compliance: FCC (USA), Industry Canada (IC), CE (Europe), VCCI (Japan), C-Tick (Australia/New Zealand), ANATEL (Brazil), CCC (China), KCC (Korea)
- For additional country certifications see: <http://www.extremenetworks.com/go/wirelesscertification>

Warranty

- Limited One Year
- For warranty details, visit www.extremenetworks.com/go/warranty

Technical Specifications

Summit WM3600

AP Capacity

- Up to 256 Adaptive APs
- Up to 48 Thin APs
- Up to 3,072 Adaptive APs per cluster
- Up to 576 Thin APs per cluster

SSIDs

- Supports 32 SSIDs
- Multi-ESS/BSSID traffic segmentation
- VLAN to ESSID mapping
- Auto Assignment of VLANs (on RADIUS authentication)
- Power Save Protocol Polling
- Pre-emptive roaming
- Congestion control with Bandwidth Management
- Multiple SSIDs per VLAN

Packet Forwarding

- 802.1D-1999 Ethernet bridging; 802.11-802.3 bridging; 802.1Q VLAN tagging and trunking; proxy ARP; IP packet steering-redirect
- Layer 2 or Layer 3

Network Security

Firewall

- Role-based wired/wireless firewall (L2-L7) with stateful inspection for wired and wireless traffic; Active firewall sessions; protects against IP Spoofing and ARP Cache Poisoning

Interfaces

- 4x 10/100/1000 Cu/SFP Ethernet
- 1x 10/100 Management port
- 1x CF card slot
- 2x USB ports
- 1x serial port (RJ-45 style)

Power Specifications

- AC input voltage: 90 – 264 VAC 50/60Hz
- Max AC input current: 6A @ 115 VAC, 3A @ 230 VAC
- Input frequency: 47 Hz to 63 Hz

Environmental Specifications

- Operating temperature: 0° C to 40° C (32° F to 104° F)
- Storage temperature: -40° C to 70° C (-40° F to 158° F)
- Operating humidity: 5% to 85% (w/o condensation)
- Storage humidity: 5% to 85% (w/o condensation)

Regulatory

- Product safety: UL / cUL 60950-1, IEC/EN60950-1
- EMC compliance: FCC (USA), Industry Canada (IC), CE (Europe), VCCI (Japan), C-Tick (Australia/New Zealand), ANATEL (Brazil), CCC (China), KCC (Korea)
- RoHS, WEEE
- For additional country certifications see: <http://www.extremenetworks.com/go/wirelesscertification>

Warranty

- Limited One Year
- For warranty details, visit www.extremenetworks.com/go/warranty

Ordering Information

Part Number	Description
Summit WM3400	
15717	Summit WM3400 WLAN controller with 6 AP support. Includes IPSEC VPN/firewall/WIPS security, location engine and 3G failover.
10051	SFP-SX optical module for use with Summit WM3000 series controller.
15738	Rack mount kit for mounting Summit WM3400 controller and the power module to a 19' rack. Optional accessory.
Summit WM3600	
15714	Summit WM3600 WLAN controller. AP capacity and feature licenses sold separately. Power cord sold separately.
15715	16 AP capacity upgrade license for Summit WM3600 controller.
15719	64 AP capacity upgrade license for Summit WM3600 controller.
15716	Real Time Location System (RTLS) feature upgrade license for Summit WM3600 controller. Enables API for 3rd party RTLS applications.
15736	Advanced security feature upgrade license for Summit WM3600 controller. Enables role-based firewall configuration and increases number of IPSEC VPN tunnels from 100 to 1024.
15734	3G feature upgrade license for the Summit WM3600 controller. Enables the use of 3G as backup or primary WAN service for remote deployment. Requires subscription to 3G service and purchase of appropriate 3G card.
10051	SFP-SX optical module for use with Summit WM3000 series controller.
Summit WM3700	
15710	Summit WM3700 WLAN controller. AP capacity and feature licenses sold separately. Power cord sold separately.
15711	16 AP capacity upgrade license for Summit WM3700 controller.
15712	64 AP capacity upgrade license for Summit WM3700 controller.
15718	256 AP capacity upgrade license for Summit WM3700 controller.
15713	Real Time Location System (RTLS) feature upgrade license for Summit WM3700 controller. Enables API for 3rd party RTLS applications.
15737	Advanced security feature upgrade license for Summit WM3700 controller. Enables role-based firewall configuration and increases number of IPSEC VPN tunnels from 600 to 2048.
10051	SFP-SX optical module for use with Summit WM3000 series controller.
